

Say goodbye to algae problems with the Smart Pond 20 S 2, by Efficient Sonics Ltd. Another ultrasonic success story, treating a beautiful pond in the National Service Resort & Country Club, Singapore.

The Golf Club management were fighting algae growth in their beautiful pond for ages. Floating algae coloured the water green, caused high maintenance costs and harmed the fish.

After many years of adding chemicals to the water, management grew tired of this unending problem. They decided to give ultrasonic treatment a try, to help solve this annoying algae bloom. A Smart Pond 20 S 2, made and developed by Efficient Sonics Ltd, comprising a single Ultrasound Generator with two Ultrasonic Transducers with the unique smart tune technology, was installed by our Distributor for Asia, CorePlan International.

The difference is plain to see in the following photographs.

Before ultrasonic treatment, the water is green and full of algae.

It is difficult to spot the fish and to see the bottom of the pond.

After 9 days, the improvement is clearly visible.

After 14 days, the water is almost clear.
